

In Connecticut, the Education Cost Sharing (ECS) formula distributes approximately \$2 billion in state education funding annually to local and regional public school districts. The ECS formula consists of a foundation, student need-based weights, and a Base Aid Ratio that determines each community's ability to financially support its public schools. The formula's foundation amount is set at \$11,525 per student and is intended to reflect the cost to educate a student who does not have any additional learning needs.

However, the foundation amount is not adjusted to reflect the annual increase in expenses such as the rising costs of personnel pursuant to collective bargaining contracts, energy costs, or inflation. This is an issue impacting districts across the state and nation, and has recently generated media attention due to the high rates of inflation the country has experienced over the past two years.

Even with the influx of federal COVID-relief aid, the rising cost to provide educational services has put a strain on school district budgets. This strain will be further exasperated when federal relief dollars expire in September 2024 and school districts face a significant fiscal cliff that will impact their ability to meet the continued needs of their students.

### What is inflation?

Inflation is when the prices for goods and services rises, leading to a decline in purchasing power over time. When the costs of goods and services rise, school districts have to spend more to provide the same educational services.

As a result, districts may need to eliminate teachers and staff, reduce programming and services, or make cuts elsewhere in order to balance their budgets. Additionally, when state funding formulas do not account and adjust for economic changes such as inflation, districts have to rely more on local funding revenue to support their operations and services.

### What can be done?

In order to mitigate the annual increasing costs of providing educational services, Connecticut can include an inflation-based adjustment<sup>1</sup> to the foundation amount in the ECS formula. This adjustment would alleviate districts' reliance on local sources to cover rising costs and would ensure all districts have the resources they need to properly operate their schools and provide their students with a high-quality education.

For example, if the State began implementing a foundation adjustment starting in fiscal year 2024, districts would immediately start receiving additional dollars to educate their students. Using the projected growth rate (5.48%) of the State's spending cap as a basis for the inflation-based adjustment, the ECS formula's foundation amount would increase by \$632 per student in FY 2024. Table 1 below estimates the ECS formula's foundation amount from FY 2024 to FY 2030 if an inflation-based adjustment was implemented.

---

<sup>1</sup> This adjustment could be structured on the allowable growth to General Fund spending in the calculation of Connecticut's spending cap. The state spending cap limits growth in spending to the level of spending in the previous year plus a percent increase based on the greater of: 5-year compound growth in personal income (calendar year basis), or 12-month increase in Core Consumer Price Index for Urban Consumers (CPI-U). This method is currently in use to adjust spending for inflation in Connecticut, is clearly defined in existing state statute, and is simple to calculate and understand.

**Table 1: Projected Adjusted Foundation Amounts Based on Spending Cap Framework<sup>2</sup>**

Foundation	FY 2024	FY 2025	FY 2026	FY 2027	FY 2028	FY 2029	FY 2030
Percent Growth Per Year	5.48%	4.11%	4.26%	3.50%	3.50%	3.50%	3.50%
Foundation Equivalent	\$12,157	\$12,656	\$13,195	\$13,657	\$14,135	\$14,630	\$15,142

When aggregated across all students, the foundation adjustment provides millions of additional dollars to communities and school districts across the state. Implementing the foundation adjustment described above would provide an estimated \$23.1 million additional dollars to Connecticut public schools in FY 2024. Based on the ECS formula's current phase-in schedule, an inflation-based foundation adjustment would provide an additional estimated \$695.1 million in FY 2030 to school districts throughout the state.

Table 2 below details the projected financial impact a foundation adjustment would have on the State's budget from FY 2024 to FY 2030.

**Table 2: State Impact of ECS Formula with Foundation Adjustment**

Year	Current ECS Formula	ECS Formula with Foundation Adjustment	Change (\$)
FY 2024	\$2,211,194,856	\$2,234,252,082	<b>\$23,057,227</b>
FY 2025	\$2,243,216,069	\$2,312,500,981	<b>\$69,284,912</b>
FY 2026	\$2,275,235,141	\$2,424,349,554	<b>\$149,114,413</b>
FY 2027	\$2,307,260,154	\$2,579,720,094	<b>\$272,459,940</b>
FY 2028	\$2,339,285,925	\$2,825,691,303	<b>\$486,405,378</b>
FY 2029	\$2,331,705,866	\$2,919,920,413	<b>\$588,214,547</b>
FY 2030	\$2,324,125,807	\$3,019,256,618	<b>\$695,130,811</b>

Although implementing an inflation-based foundation adjustment would ensure all public school districts have the resources to educate their students regardless of economic changes, estimates suggest this change to the ECS formula would require an additional \$2.3 billion investment from the State.

Additionally, it would be difficult to predict future changes to the ECS formula's foundation, as inflation can be uncertain and can vary significantly from year to year. Including this adjustment, therefore, will impact the State's ability to project future ECS appropriations and may lead to unexpected increases in state spending due to unexpected rates of inflation.
